

INSTALLATION INSTRUCTIONS

PACKAGE HEAT PUMP & AIR CONDITIONING

FEATURING R-410A

14 SEER & 12 EER_a SERIES - (2-5Tons)

RECOGNIZE THIS SYMBOL AS AN INDICATION OF IMPORTANT SAFETY INFORMATION

WARNING

These instructions are intended as an aid to qualified licensed service personnel for proper installation, adjustment and operation of this unit. Read these instructions thoroughly before attempting installation or operation. Failure to follow these instructions may result in improper installation, adjustment, service or maintenance possibly resulting in fire, electrical shock, property damage, personal injury or death.

DO NOT DESTROY THIS MANUAL

Please read carefully and keep in a safe place for future reference by a serviceman.

This document is customer property and is to remain with this unit. These instructions do not cover all the different variations of systems nor does it provide for every possible contingency to be met in connection with installation.

All phases of this installation must comply with NATION, STATE AND LOCAL CODES. If additional information is required please contact your local distributor.

1.0 SAFETY

When you see the symbols below on labels or in the manual, be alert to the potential or immediate hazards of personal injury, property and/or product damage. It is the owner's or installer's responsibility to comply with all safety instructions and information accompanying these symbols.

WARNING: This is a safety alert symbol indicating a potential hazardous situation, which could result in personal injury, property and/or product damage or death.

CAUTION: This is a safety alert symbol indicating a potential hazardous situation, which could result in moderate personal injury, and/or property and product damage.

WARNING

These instructions are intended as an aid to qualified, licensed service personnel for proper installation, adjustment and operation of this unit. Read these instructions thoroughly before attempting installation or operation. Failure to follow these instructions may result in improper installation, adjustment, service or maintenance possibly resulting in fire, electrical shock, property damage, personal injury or death.

WARNING

The manufacturer's warranty does not cover any damage or defect to the heat pump caused by the attachment or use of any components, accessories or devices (other than those authorized by the manufacturer) into, onto or in conjunction with the heat pump. You should be aware that the use of unauthorized components, accessories or devices may adversely affect the operation of the heat pump and may also endanger life and property. The manufacturer disclaimer any responsibility for such loss or injury resulting from the use of such unauthorized components, accessories or devices.

WARNING

Disconnect all power to the unit before starting maintenance. Failure to do so can result in severe electrical shock or death.

WARNING

Do not, under any circumstances, connect return ductwork to any other heat producing device such as a fireplace insert, stove, etc. Unauthorized use of such devices may result in fire, carbon monoxide poisoning, explosion, property damage, severe personal injury or death.

WARNING

The unit must be permanently grounded. A grounding lug is provided. Failure to ground this unit can result in fire or electrical shock causing property damage, severe personal injury or death.

WARNING

Only electric heater kits supplied by this manufacturer as described in this publication have been designed, tested, and evaluated by a nationally recognized safety testing agency for use with this unit. Use of any other manufactured electric heaters installed within this unit may cause hazardous conditions resulting in property damage, fire, bodily injury or death.

WARNING

Proposition 65: This appliance contains fiberglass insulation. Respirable particles of fiberglass are known to the state of California to cause cancer.

1.1 INSPECTION

As soon as unit is received, it should be inspected and noted for possible shipping damage during transportation. It is carrier's responsibility to cover the cost of shipping damage. Manufacturer or distributor will not accept the claims from dealer for any transportation damage.

1.2 LIMITATIONS

Refer to *Fig. 2-2, 2-3* for unit physical data and to *Table 7-1* for electrical data. If components are to be added to a unit they must meet local codes, they are to be installed at the dealer's and /or the customer's expense. Size of unit for proposed installation should be based on heat loss / heat gain calculations made in accordance with industry recognized procedures identified by the Air conditioning contractors of America.

2.0 INSTALLATION

2.1 PRE-INSTALLATION

Before installation, carefully check the following:

1. Unit should be installed in accordance with national and local safety codes, including but not limit to ANSI/NFPS No. 70 or Canadian Electrical Code Part 1, C22.1, local plumbing and wastewater codes and any other applicable codes.
2. For rooftop installation, be sure the structure has enough strength to support the weight of unit. Unit should be installed on roof curb and leveled.
3. For ground level installation, a level slab should be used.
4. Condenser airflow should not be restricted.
5. On applications when a roof curb is used, the unit must be positioned on the curb so the front of the unit is tight against the curb.

2.2 CLEARANCE

All units require certain clearance for proper operation and service. Refer to *Table 2-1* for the clearances required for construction, servicing and proper unit operation.

2.3 RIGGING AND HANDLING

Exercise care when moving the unit. Do not remove any packaging until the unit is near the place of installation. Rig the unit by attaching chain or cable slings to the lifting holes provided in the base rails. Spreader bars, whose length exceeds the largest dimension across the unit, MUST be used across the top of the unit.

CAUTION

Before lifting, make sure the unit weight is distributed equally on the rigging cables so it will lift evenly.

Units may be moved or lifted with a forklift. Slotted openings in the base rails are provided for this purpose.

CAUTION

All panels must be secured in place when the unit is lifted. The condenser coils should be protected from rigging cable damage with plywood or other suitable material.

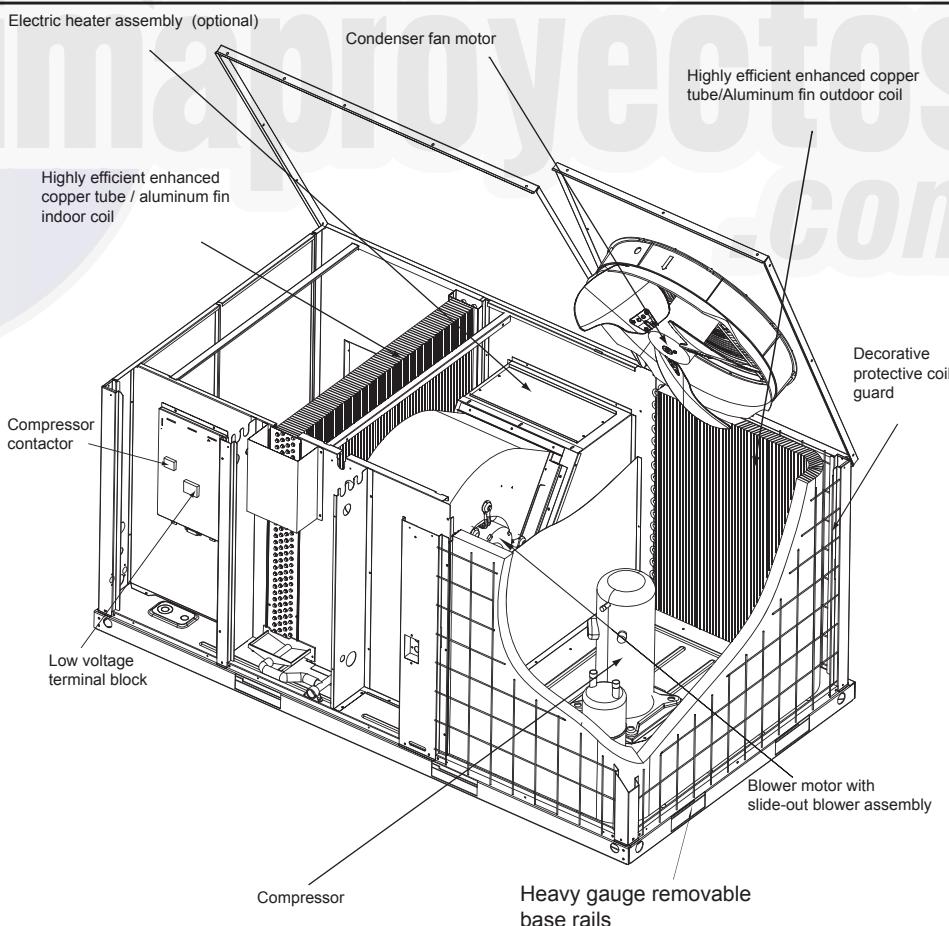

Fig. 2-1 Component Location

* The above figure for reference purpose only.

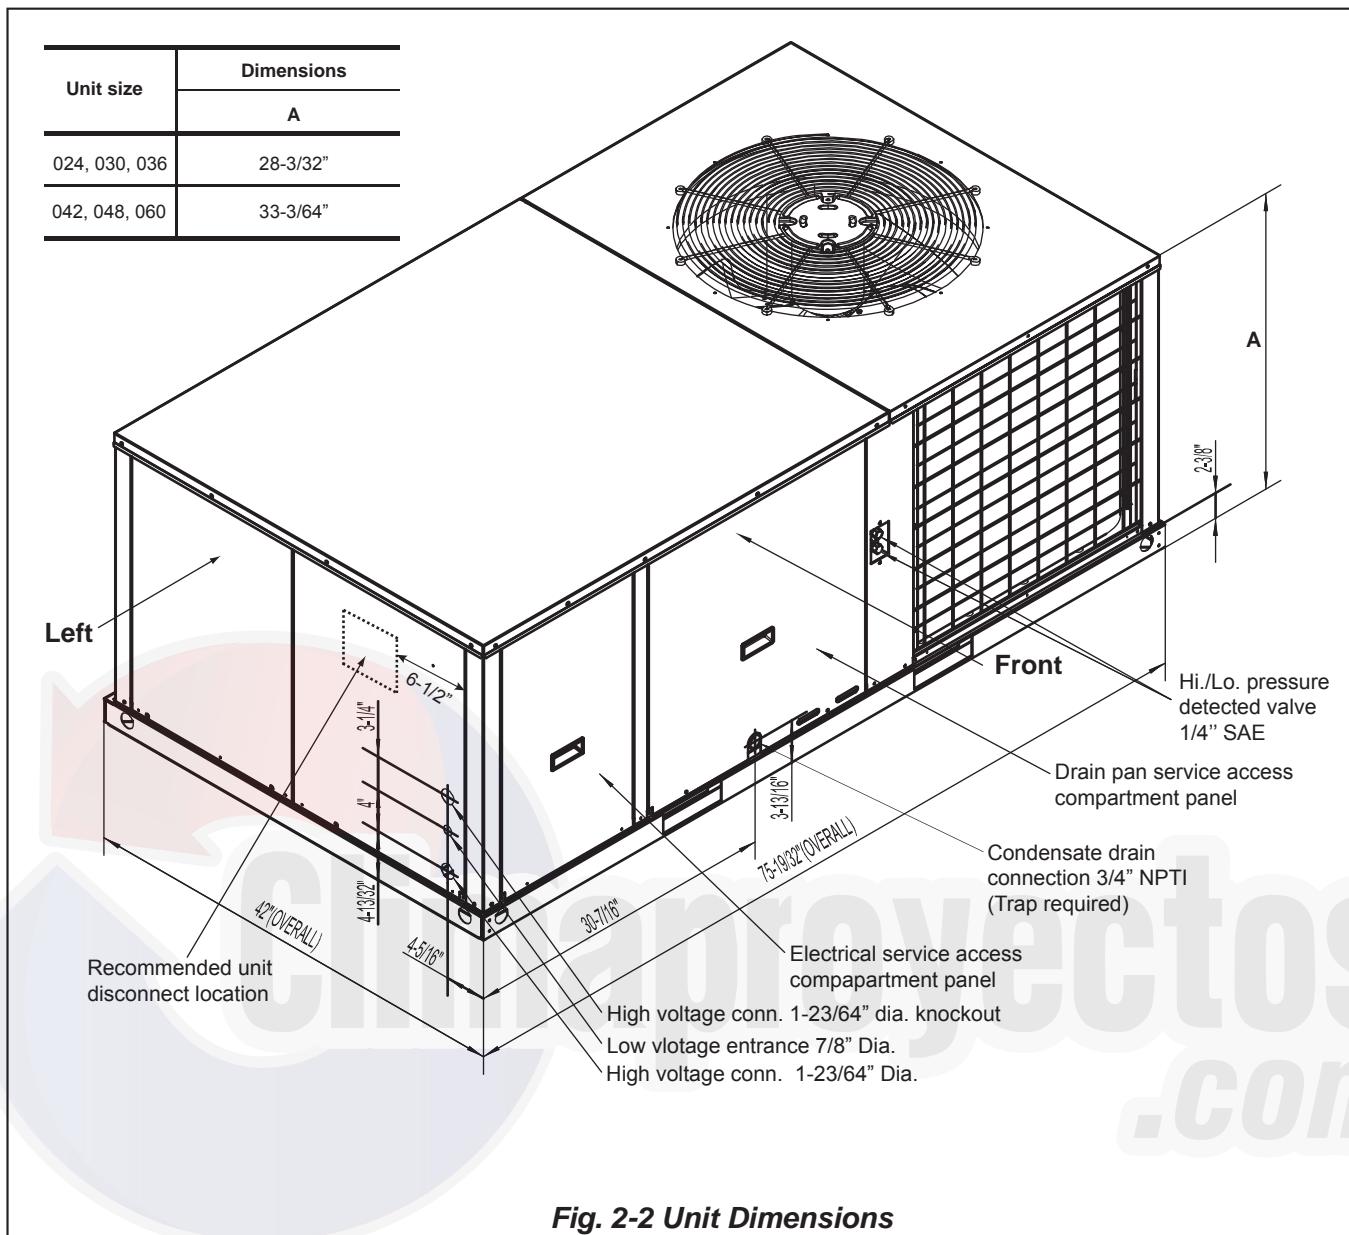

Fig. 2-2 Unit Dimensions

* The above figure for reference purpose only.

Table 2-1: Unit Clearance

Direction	Distance (in.)	Direction	Distance (in.)
Top ¹	60	Right	12
Front	30	Left	24
Rear	18 ²	Bottom ³	0

Duct clearance: 1 inch clearance for all sides of air supply duct.

1. Units must be installed outdoors. Over hanging structure or shrubs should not obscure condenser air discharge outlet.
2. The minimum clearance without economizer/fresh air damper. For distance with Economizer/fresh air damper, please refer to the relevant Install requirement.

NOTE

For units applied with a roof curb, the minimum clearance may be reduced from 1 inch to 1/2 inch between combustible roof curb material and this supply air duct.

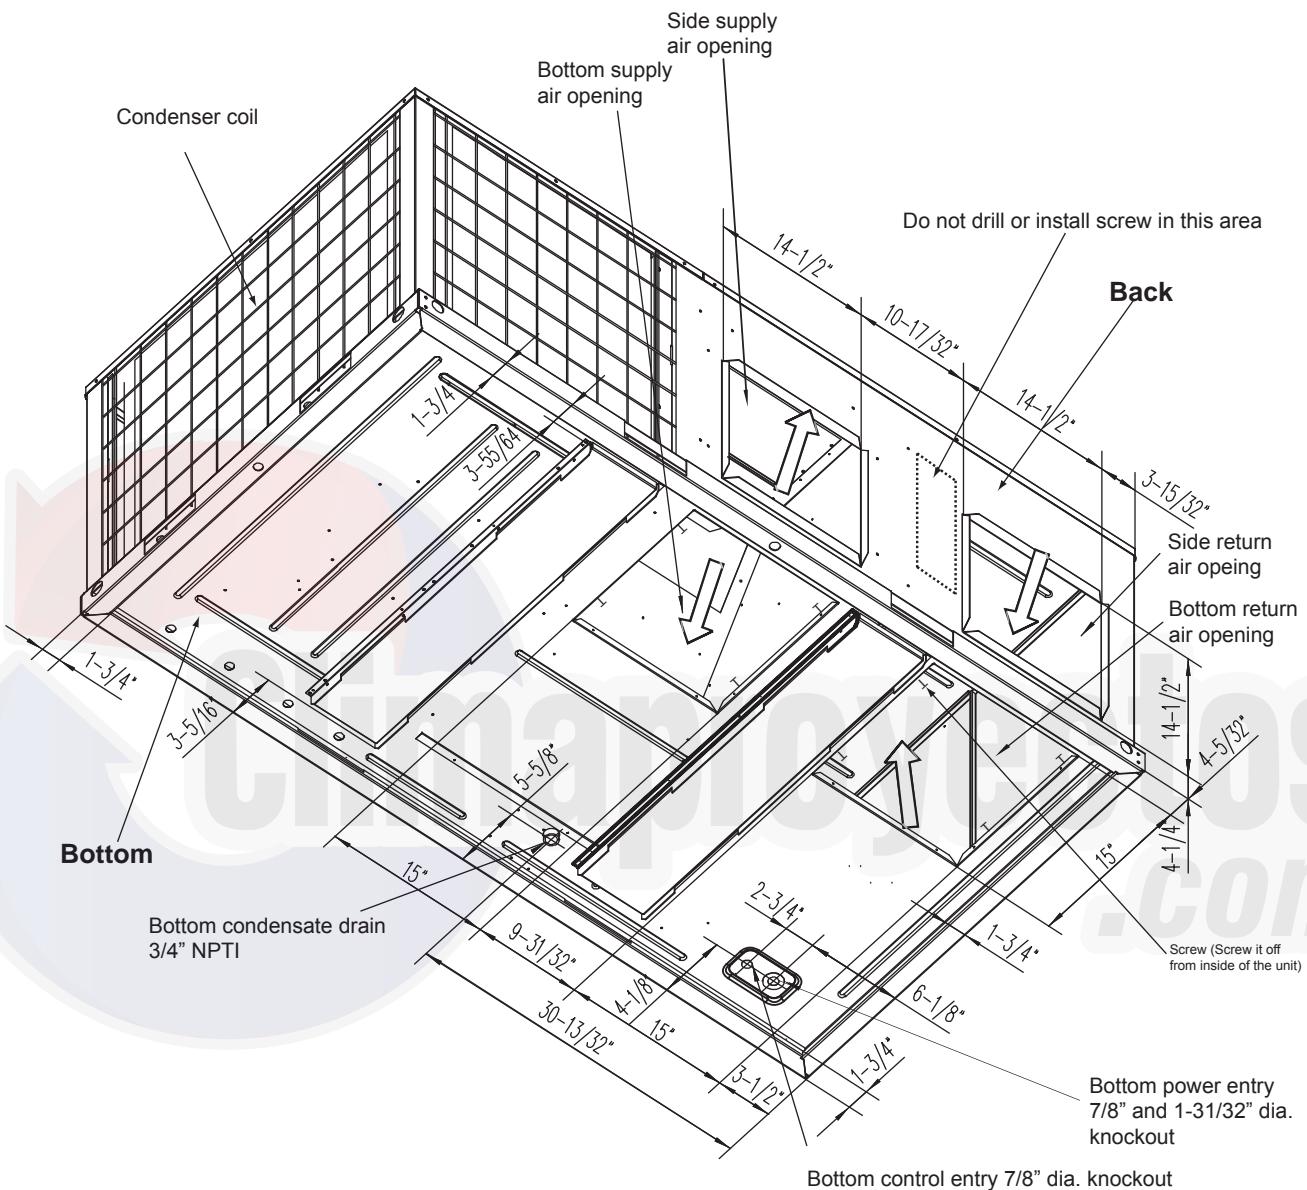

Fig. 2-3 Dimensions Back And Bottom

* The above figures for reference purpose only.

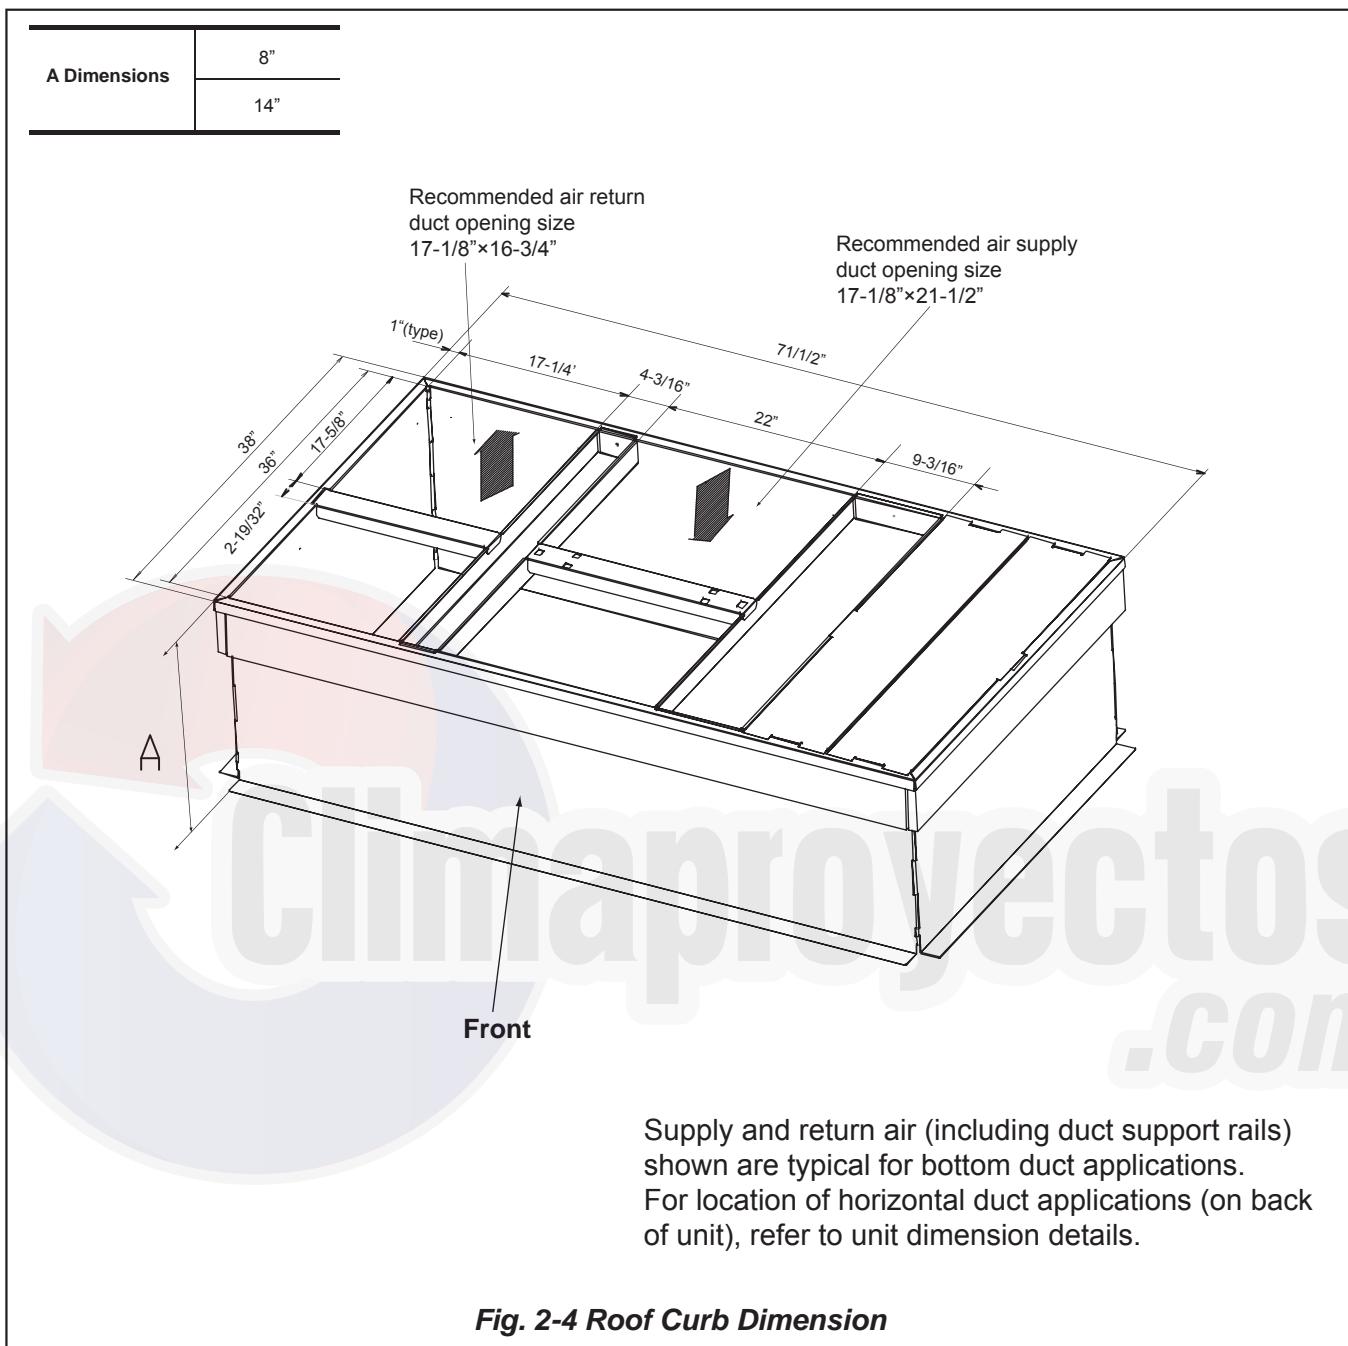

Fig. 2-4 Roof Curb Dimension

* The above figures for reference purpose only.

NOTE

Be sure to note supply and return openings.
Refer to Fig.2-3, 2-4 for information concerning rear and bottom supply and return air duct openings.

2.4 ROOF CURB

On applications when a roof curb is used, the unit must be positioned on the curb so the front of the unit is tight against the curb. (See Fig. 2-4 ROOF CURB DIMENSION)

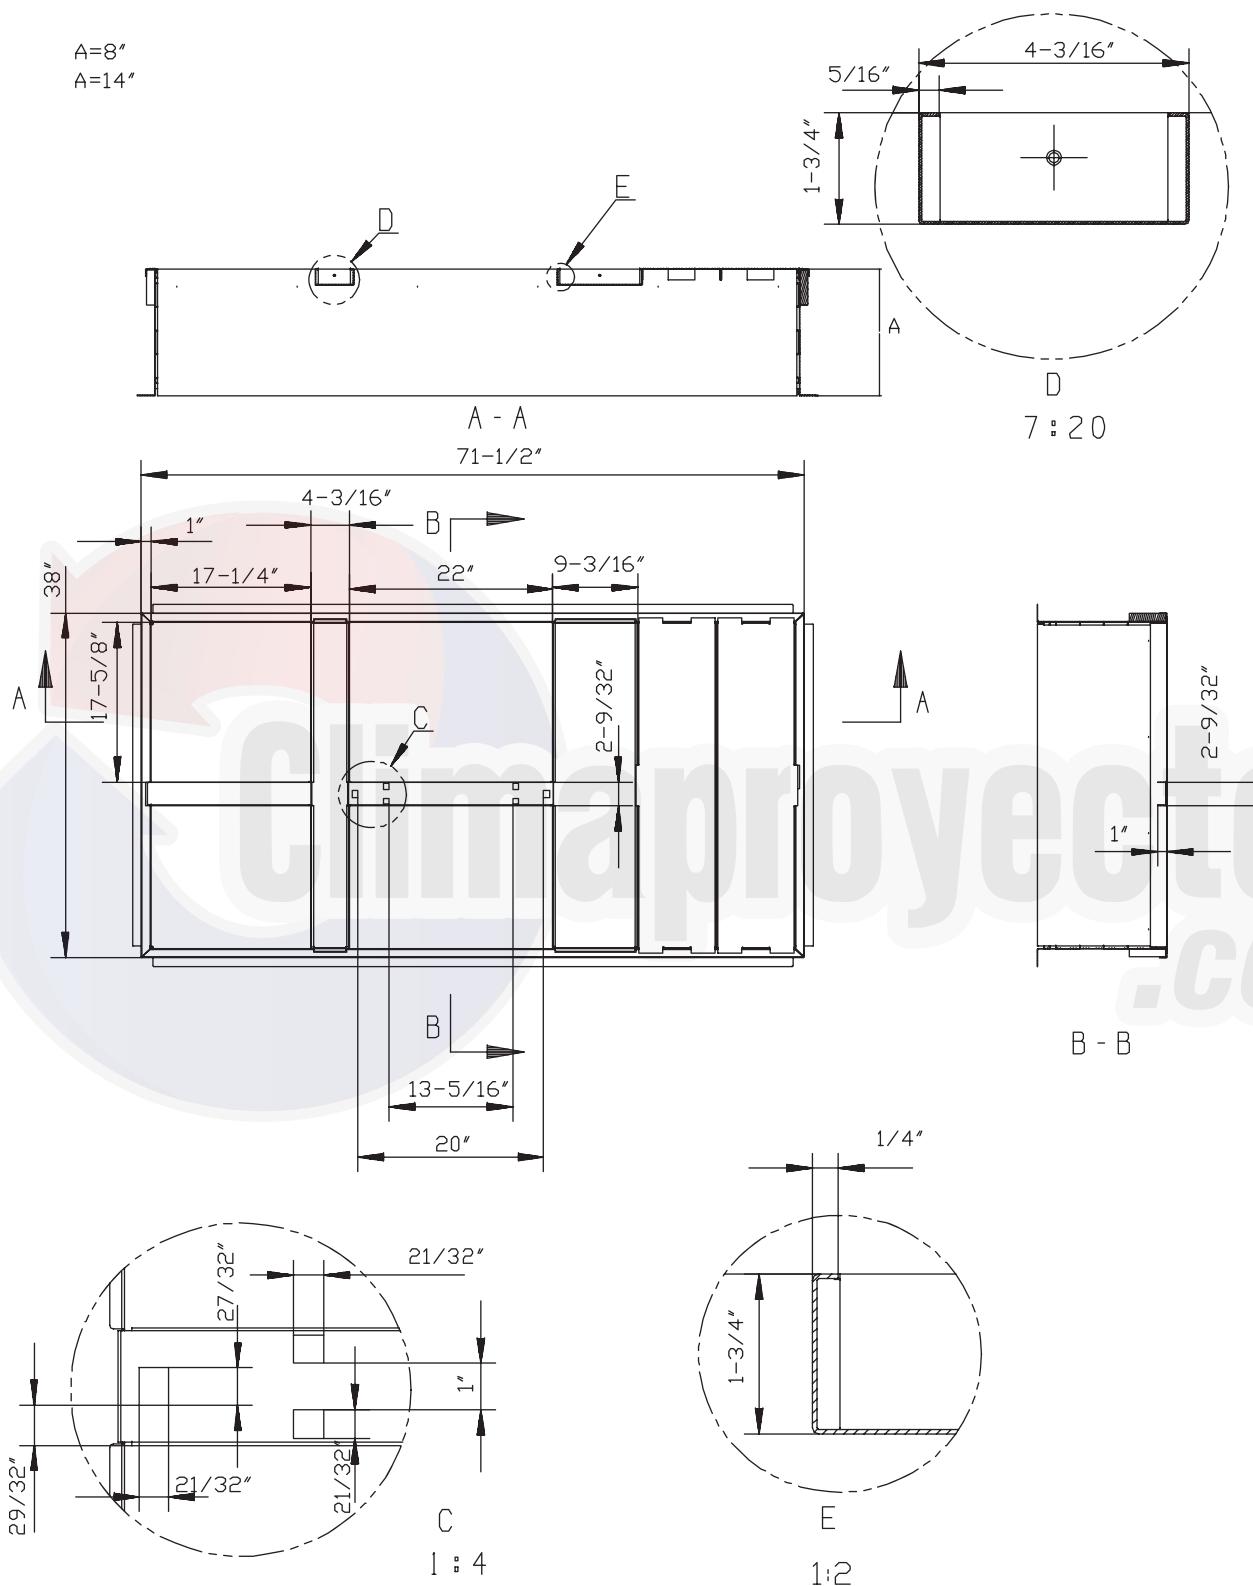

Fig.2-5 Roof Curb Details

3.0 DUCTWORK

Ductwork should be made and sized by installer and in accordance with Air Manual from Conditioning Contractors of America and local codes.

NOTE

On ductwork exposed to outside air conditioning space, use at least 2" of insulation and a vapor barrier. Flexible joint may be used to reduce noise.

These units are adaptable to downflow use as well as rear supply and return air duct openings. To convert to downflow, use the following steps:

1. Remove the duct covers found in the bottom return and supply air duct openings. There are four (4) screws securing each duct cover (save these to use in step 2).
2. Install the duct cover (removed in step one) to the rear supply and return air openings. Secure with the four (4) screws used in steps one.
3. Seal duct covers with silicone caulk.

A closed return duct system shall be used. This shall not preclude use of economizers or ventilation air intake. Flexible joints may be used in the supply and return duct work to minimize the transmission of noise.

CAUTION

When fastening duct work to the side duct flanges on the unit, insert the screws through the duct flanges only. DO NOT insert the screws through the casing. Outdoor duct work must be insulation and waterproofed.

NOTE

Be sure to note supply and return openings. Refer to Fig. 3 and 4 for information concerning rear and bottom supply and return air duct openings.

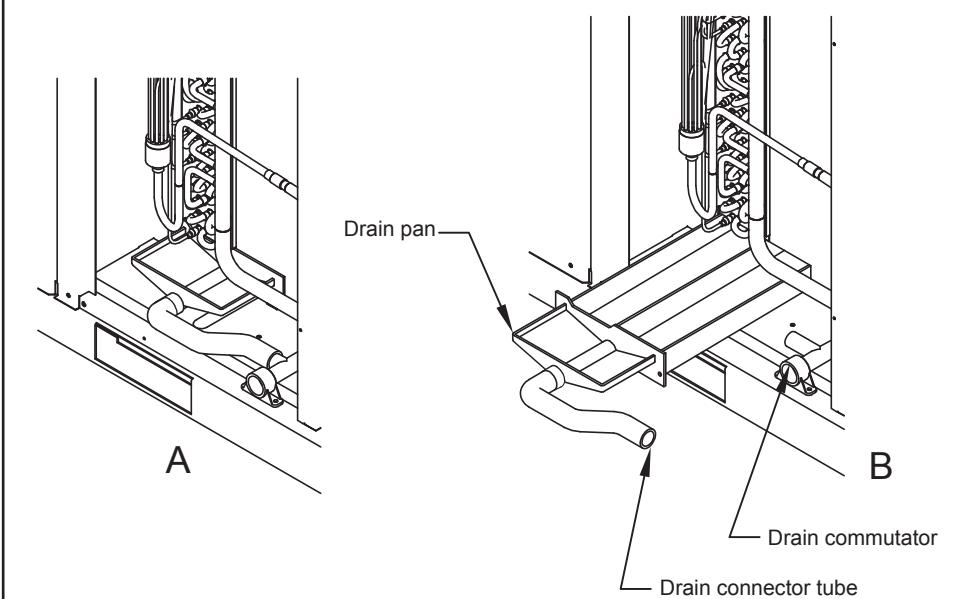

4.0 CONDENSATE DRAIN CONNECTION

Consult local codes for special requirements.

To provide extra protection from water damage, install an additional drain pan, provided by installer, under the entire unit with a separate drain line. Manufacturer will not be responsible for any damages due to the failure to follow these requirements.

4.1 INSTALL DRAIN PIPE

1. Use female NPT threaded fitting for outside connection and make sure that drain holes are not blocked.
2. Insulation may be needed for drain line to prevent sweating.
3. Drain pan has two drain connections on each side to provide flexibility of connection and drainage. Make sure proper pitch and plugging if second connection is not used.
4. Use a sealing compound on male pipe threads. Install the condensate drain line (NPT) to spill into an open drain.

**Fig. 4-1 Removable Condensate Drain Pan
And Removal Procedure**

4.2 REMOVAL AND CLEAN THE DRAIN PAN

See above Figure 4-1 B, disconnect the Connective Tube and Drain Commutator, screw off the two fixed screws of Drain Pan, and then along with the rail pull out the Drain Pan and Connective Tube from the bottom of evaporator. Using a wet cloth or water to wash out the drain pan carefully.

5.0 FILTERS

Units are shipped without a filter or filter racks. It is the responsibility of the installer to secure a filter in the return air ductwork or install a filter/frame Kit.

Filter must always be used and must be kept clean. When filter become dirt laden, insufficient air will be delivered by the blower, decreasing your units efficiency and increasing operation costs and wear-and tear on the unit and controls.

Filters should be checked monthly; this is especially important since this unit is used for both heating and cooling.

6.0 ELECTRICAL WIRING

Field wiring must comply with the National Electric Code (NEC) or Canadian Electrical Code (CEC) and any applicable local ordinance.

WARNING

Disconnect all power to unit before installing or servicing. More than one disconnect switch may be required to de-energize the equipment. Hazardous voltage can cause severe personal injury or death.

6.1 POWER WIRING

1. Proper electrical power should be available at unit. Voltage tolerance should not be over 10% from rating voltage.
2. If any of the wire must be replaced, replacement wire must be the same type as shown in nameplate, wiring diagram and electrical data sheet.
3. Install a branch circuit disconnect of adequate size to handle starting current, located within sight of, and readily accessible to the unit.
4. ELECTRIC HEATER - If the Electric Heater is installed, unit may be equipped with 25~60A. circuit breakers or fuse. These breaker(s) protect the internal wiring in the event of a short circuit and serve as a disconnect. Circuit breakers installed within the unit do not provide over-current protection of the supply wiring and therefore may be sized larger than the branch circuit protection.
 - Supply circuit power wiring must be 221 °F minimum copper conductors only. See Electrical Data in this section for ampacity, wire size and circuit protector requirements. Supply circuit protective devices may be either fuses or "HACR" type circuit breakers.
 - An 1-3/8" knockouts inside cabinet is provided for connection of power wiring to electric heater.
 - Power wiring is connected to the power terminal block in unit electric cabinet.

See Electrical Heater Installation Instruction for details.

6.2 GROUNDING

WARNING

The unit must be permanently grounded. Failure to do so can result in electrical shock causing personal injury or death.

- Grounding may be accomplished by grounding metal conduit when installed in accordance with electrical codes to the unit cabinet.
- Grounding may also be accomplished by attaching ground wire(s) to ground lug(s) provided in the unit wiring compartment.

6.3 CONTROL WIRING

IMPORTANT: Class 2 low voltage control wiring SHOULD NOT be run in conduit with main power wiring and must be separated from power wiring, unless class 1 wire of proper voltage rating is used.

- Low voltage control wiring should be 18 AWG color-coded. For lengths longer than 50 ft, 16 AWG wire should be used.
- Two 7/8" holes can be used for control wires going into the unit, one on left side and one at the bottom.
- Make sure, after installation, separation of control wiring and power wiring has been maintained.

Thermostat should be mounted on an inside wall about 58" from floor and will not be affected by unconditioned air, sun and/or heat exposure. Follow the instruction carefully because there are many wiring requirements.

See Fig. 6-1 ~ 2, Table 7-1 ~ 4

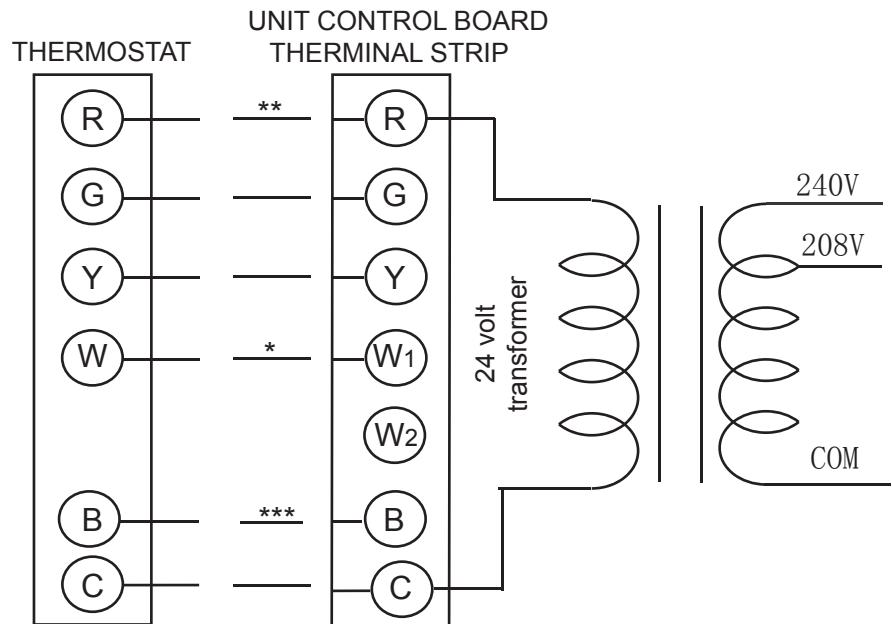

Fig. 6-1 Typical Field Control Wiring Diagram

- *** B wire be used with heat pump system only.
- ** Minimum wire size of 18 AWG wire should be used for all field installed 24 volt wire.
- * Only required on units with supplemental electric heat.

CAUTION

Label all wire prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation. Verify proper operation after servicing.

7.0 AIRFLOW PERFORMANCE

Airflow performance data is based on cooling performance with a coil and no filter in place. Use this performance table for appropriate unit size, external static applied to unit and allow operation within the minimum and maximum limits shown in table below for both cooling and electric heat operation.

7.1 AIRFLOW PERFORMANCE DATA

Table 7-1 Side Duct Application

Model Number	Motor Speed	CFM(L/S)(Watts)								
		External Static Pressure-Inches W.C.[kPa]

* The above airflow data for reference only.

** Default as high speed of factory settings.

- The air distribution system has the greatest effect on airflow. The duct system is totally controlled by the contractor. For this reason, the contractor should use only industry-recognized procedures.
- Heat pump systems require a specified airflow. Each ton of cooling requires between 350 and 450 cubic feet of air per minute (CFM), or 400 CFM nominally.
- Duct design and construction should be carefully done. System performance can be lowered dramatically through bad planning or workmanship.
- Air supply diffusers must be selected and located carefully. They must be sized and positioned to deliver treated air along the perimeter of the space. If they are too small for their intended airflow, they become noisy. If they are not located properly, they cause drafts. Return air grilles must be properly sized to carry air back to the blower. If they are too small, they also cause noise.
- The installers should balance the air distribution system to ensure proper quiet airflow to all rooms in the home. This ensures a comfortable living space.
- An air velocity meter or airflow hood can give a reading of system CFM.
- When installation, installer should select the air speed according to the actual setting static pressure. Please refer to the *Table 7-1, 7-2 AIRFLOW PERFORMANCE DATA*.

8.0 SYSTEM OPERATION

8.1 COMPRESSOR CRANKCASE HEATER(Optional)

Refrigerant migration during the off cycle can result in a noisy start up. Add a crankcase heater to minimize refrigeration migration, and to help eliminate any start up noise or bearing "wash out".

All heaters are located on the lower half of the compressor shell. Its purpose is to drive refrigerant from the compressor shell during long off cycles, thus preventing damage to the compressor during start-up.

At initial start-up or after extended shutdown periods, make sure the heater is energized for at least 12 hours before the compressor is started. (Disconnect switch on and wall thermostat off.)

The crankcase heater start-up conditions:

If the outdoor ambient temp. is $<37.4^{\circ}\text{F}$ and the compressor stopped for more than three hours or the unit powered on once more, the crank heater will be on.

Crankcase heater shut-down conditions:

If the outdoor ambient temp. is $>44.6^{\circ}\text{F}$ or the compressor start running ,the crank heater will be off.

8.2 Protection (For HP system only)

When the sensor T3 (**Condenser pipe temperature**) &T4 (**Outdoor ambient temperature**) was checked open-circuit, the compressor, outdoor fan motor and 4-way valve will be off.

Discharge temperature protection

When discharge temp. is $>275^{\circ}\text{F}$, the compressor will be off,

When discharge temp. is $<194^{\circ}\text{F}$, the compressor will start running.

High pressure protection

When high pressure is $>638\text{PSIG}$, the compressor and the outdoor fan motor will stop running.

When high pressure is $<464\text{PSIG}$, the compressor and the outdoor fan motor will start running(3 minutes delay necessary).

Low pressure protection

When low pressure is $<21\text{PSIG}$, the compressor and the outdoor fan motor will stop running.

When low pressure is $>44\text{PSIG}$, the compressor and the outdoor fan motor will start running(3 minutes delay necessary).

In stand-by status, if low pressure protection was checked out, the compressor would not start running.

If protection cycles occur four times within 30 mins, the system must power on once more.

T4 function:

When T4 is $< 5^{\circ}\text{F}$, the compressor will stop. If the electrical heater kit is installed

in the indoor unit, the outdoor unit will send the operation signal to the indoor unit.

When T4 is $> 10.4^{\circ}\text{F}$, the compressor will restart.

8.3 DEFROST MODE* (For HP system only)

Defrosting condition:

When JUMP switch is set to "1", the defrost mode will start if one of following conditions is satisfied:

1. Compressor keeps running, when T4 is $> 28.4^{\circ}\text{F}$ and T3 is $< 32^{\circ}\text{F}$ and last for 40 minutes;
2. Compressor keeps running, when T4 is $< 28.4^{\circ}\text{F}$ and T3 is $< 32^{\circ}\text{F}$ and last for 50 minutes.

* When defrosting Actions, if the electrical heater kit is installed in the indoor unit, the outdoor unit would deliver the Aux. heater operation signal to the indoor unit.

When JUMP switch is set to "0":
Compressor keeps running, when T3 is < 32 °F and last for 30 minutes.

Ending conditions of defrost mode:

The mode will end if one of following conditions is satisfied:

1. The defrosted time lasting for 10 minutes;
2. When JUMP switch is set to "1", T3 is ≥64.4°F;
3. When JUMP switch is set to "0", T3 is ≥77°F.

8.4 MANUAL DEFROST MODE (For HP system only)

When MANUAL DEFROST switch in PCB is set to "1", system will perform as above 8.3 description.

When the switch is set to "0", T3<32°F, compressor keeps working last for about 40 seconds, after then system turns to the Defrost Mode. By the logic of 8.3 to exit the Defrost Mode.

Caution: Once finishes the manual defrost, please switch the MANUAL DEFROST in PCB to "1".

	OFF	Blower fan delay 90 sec. OFF Compressor and outdoor fan instant OFF 4-way valve instant OFF Heater 1 instant OFF Heater 2 instant OFF

8.6 Phase sequence protection (For 3 phase system only)

NOTE

Cut off the power supply when outdoor appear "POWER PHASE FAILURE". Switch on power supply again after 10 seconds if correct wiring connected.

When connected to the power in the right order but the compressor does not work, the LED indicator in the PCB board of the condensing unit will flash four times a cycle. To correct, make sure that the power supply is three phase, then exchange any two of the power input terminals among the L1, L2 or L3 and this should correct problem.

8.7 DC motor protection (For 60K system only)

If the speed of the DC motor is too high or too low, then it will enter to the fault state, and under fan fault that the electric heater and the compressor will be switched off, and then the fan will be re-operated after 1 minute; If there are 3 times fault occur in 1 hour, then it will be recovered until power off.

9.0 OPERATION CHECK-UP

• Cooling Startup

1. Turn thermostat to OFF and turn power to ON
2. Turn ON thermostat and set as high as possible
3. Turn Fan switch ON and indoor blower should run
4. Turn fan switch to AUTO, system switch to COOL and thermostat temperature setting below room temperature.
Unit should run in COOLING mode.

• Heating Startup

After normal cooling run

1. Turn thermostat switch to HEAT. After unit stops, wait about 5 minutes.
2. Turn thermostat setting above room temperature.
Unit should run in HEATING mode.

After unit has run for a while, check the following:

1. Are fans running properly?
2. Is compressor running correctly?
3. Check refrigerant charge.
4. Check duct connection and leaks.
5. Check tubing and sheet metal rattles.

(See Wiring Diagram for electric connection detail.)

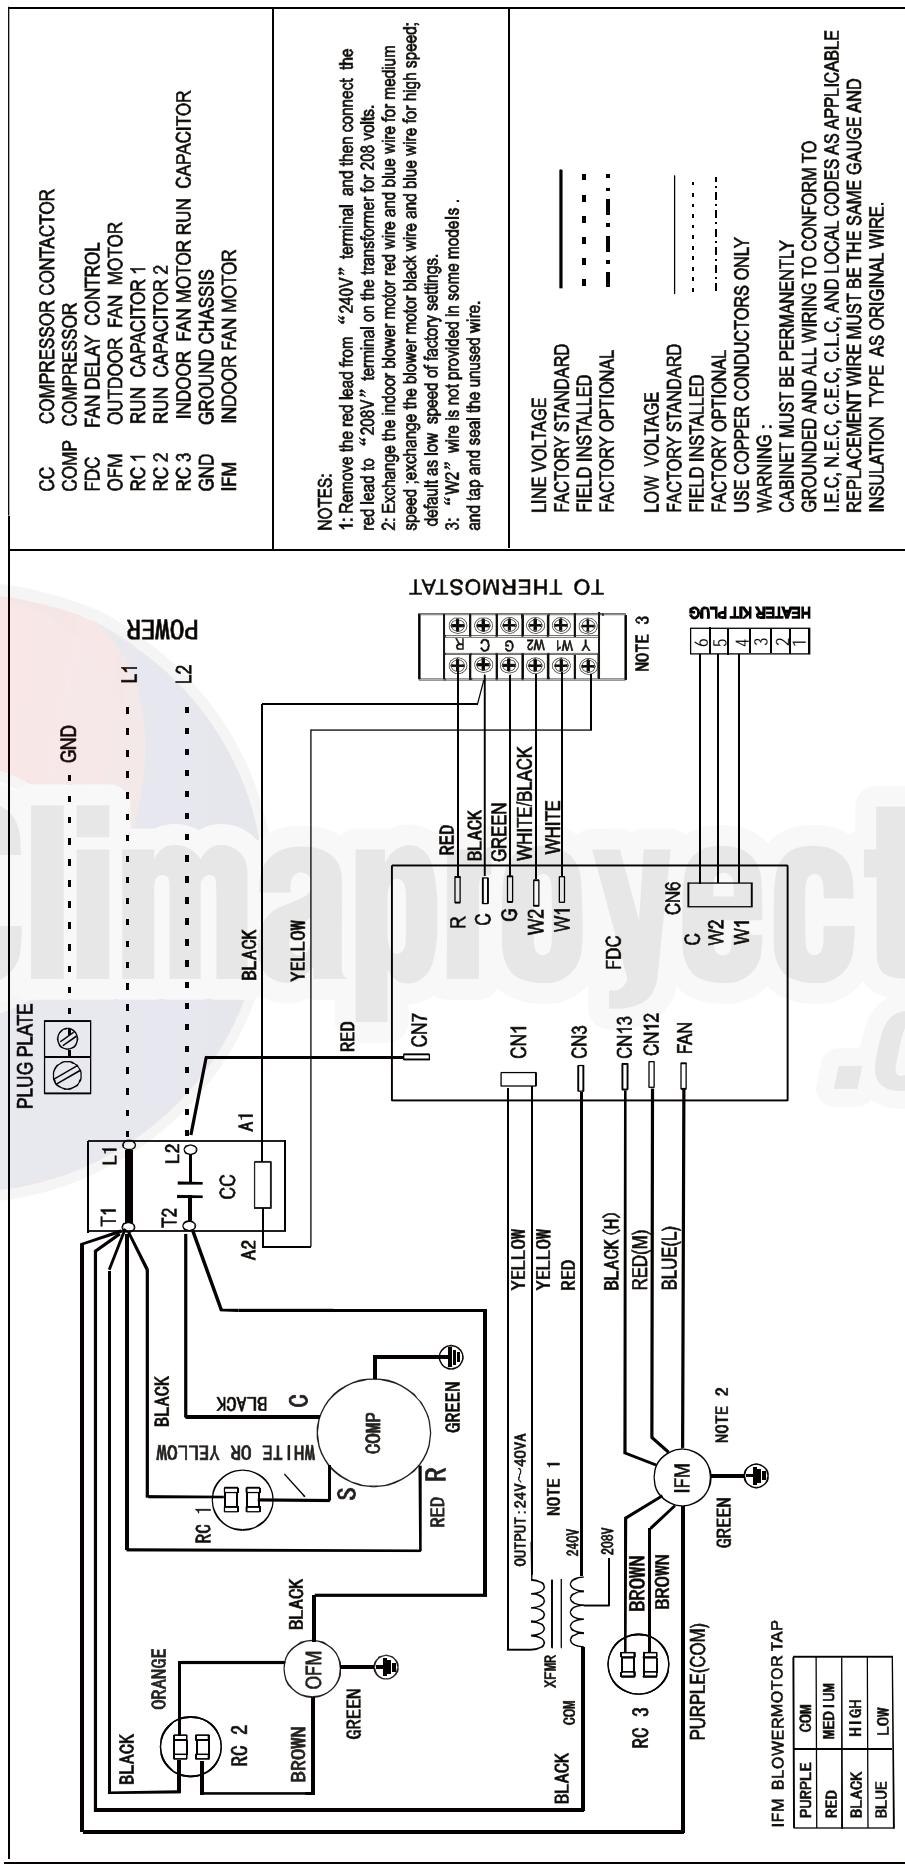

10.0 TROUBLE SHOOTING

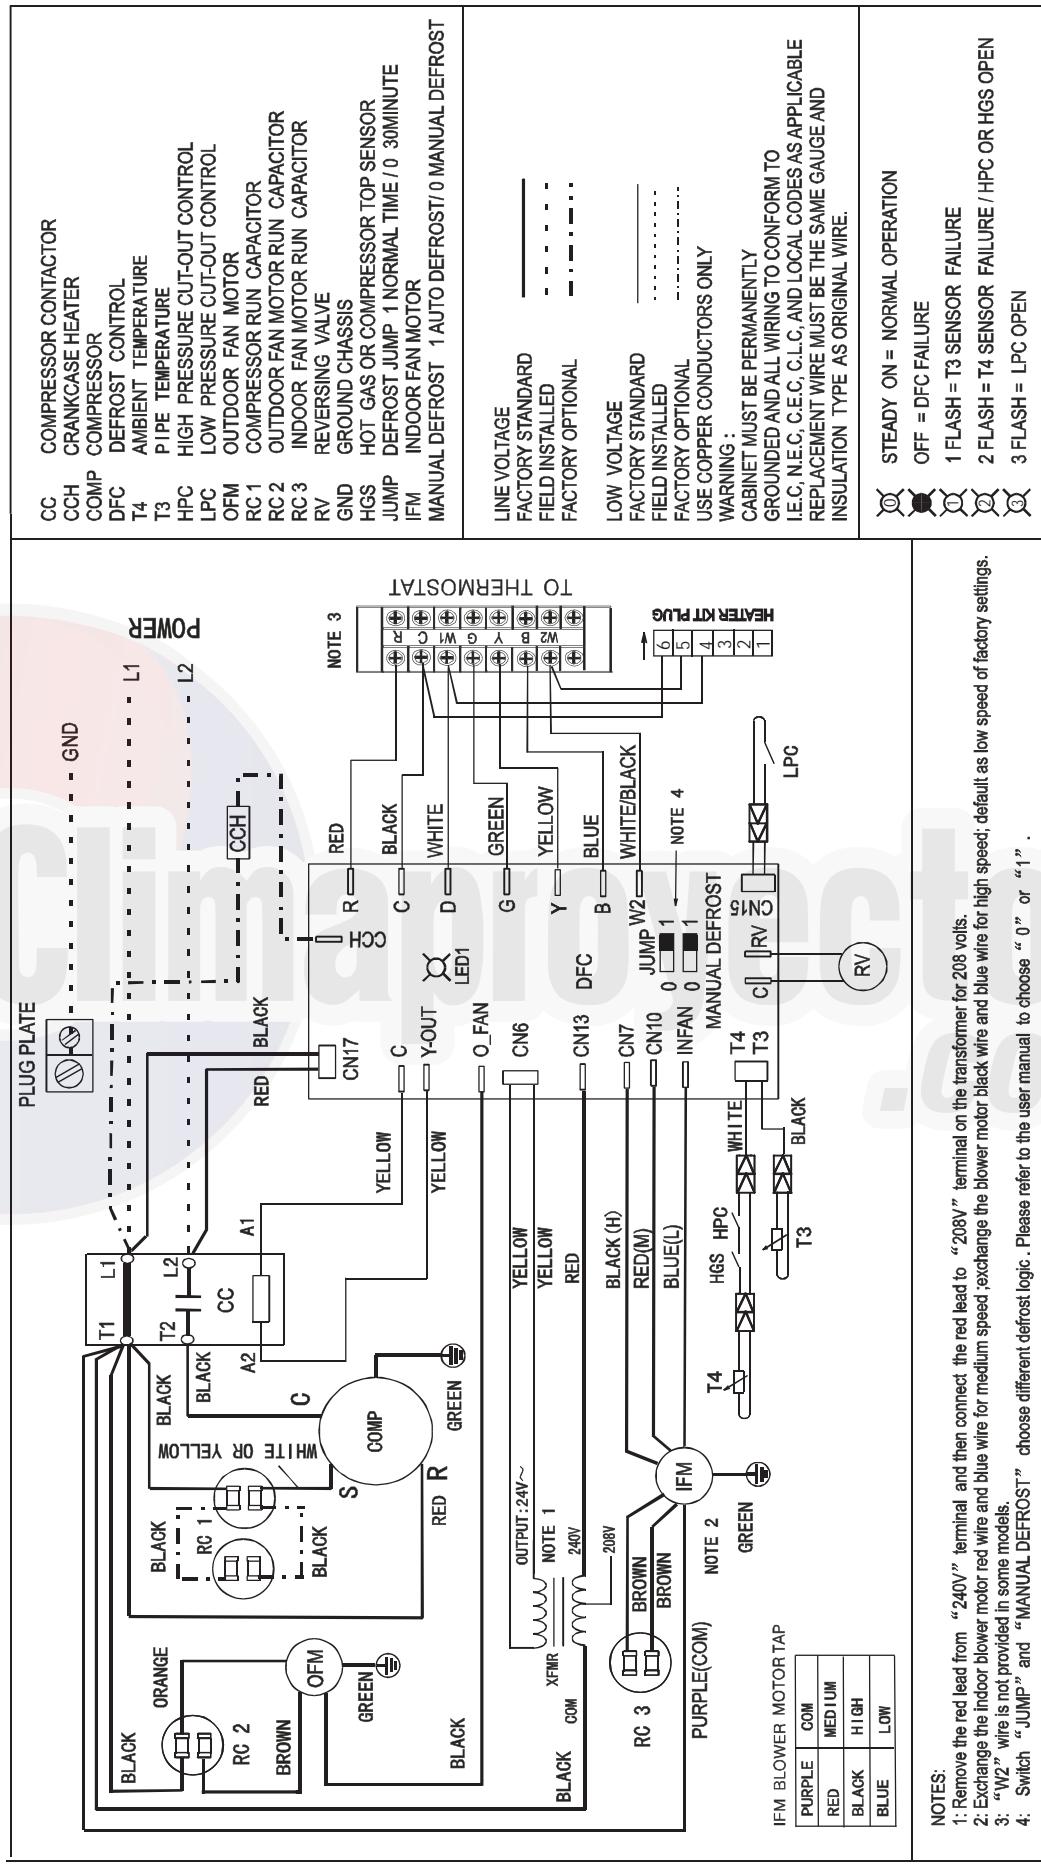

WARNING

Components trouble shooting requires opening control box with power on. Use extreme care while working on this condition. Check nameplate and this instruction when making wire connections.

AC System Wiring Diagram (60K 1 phase)

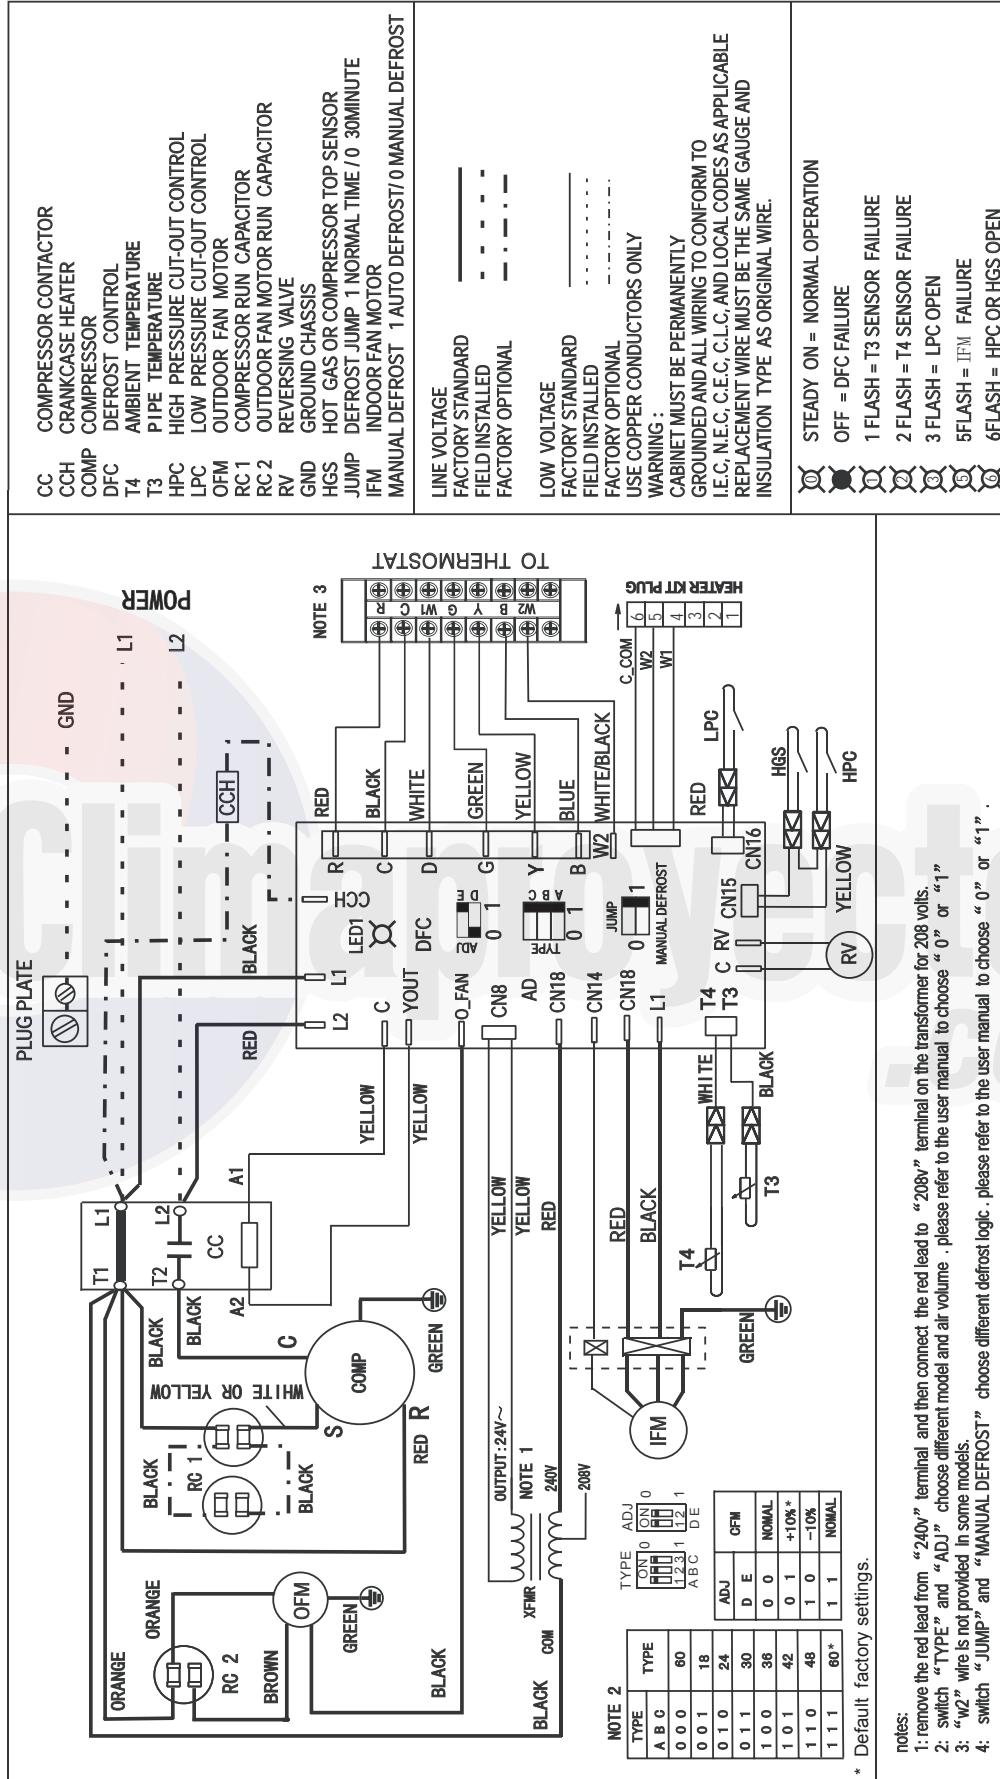

* Default factory settings.

- NOTES:**

 - 1: Remove the red lead from "240V" terminal and then connect the red lead to "208V" terminal on the transformer for 208 volts.
 - 2: switch "TYPE" and "ADJ" choose different model and air volume - please refer to the user manual to choose "0" or "1".
 - 3: "W2" wire is not provided in some models and "B" is only for HP unit.
 - 4: "MANUAL DEFROST" and "JUMP" is unavailable for AC unit.

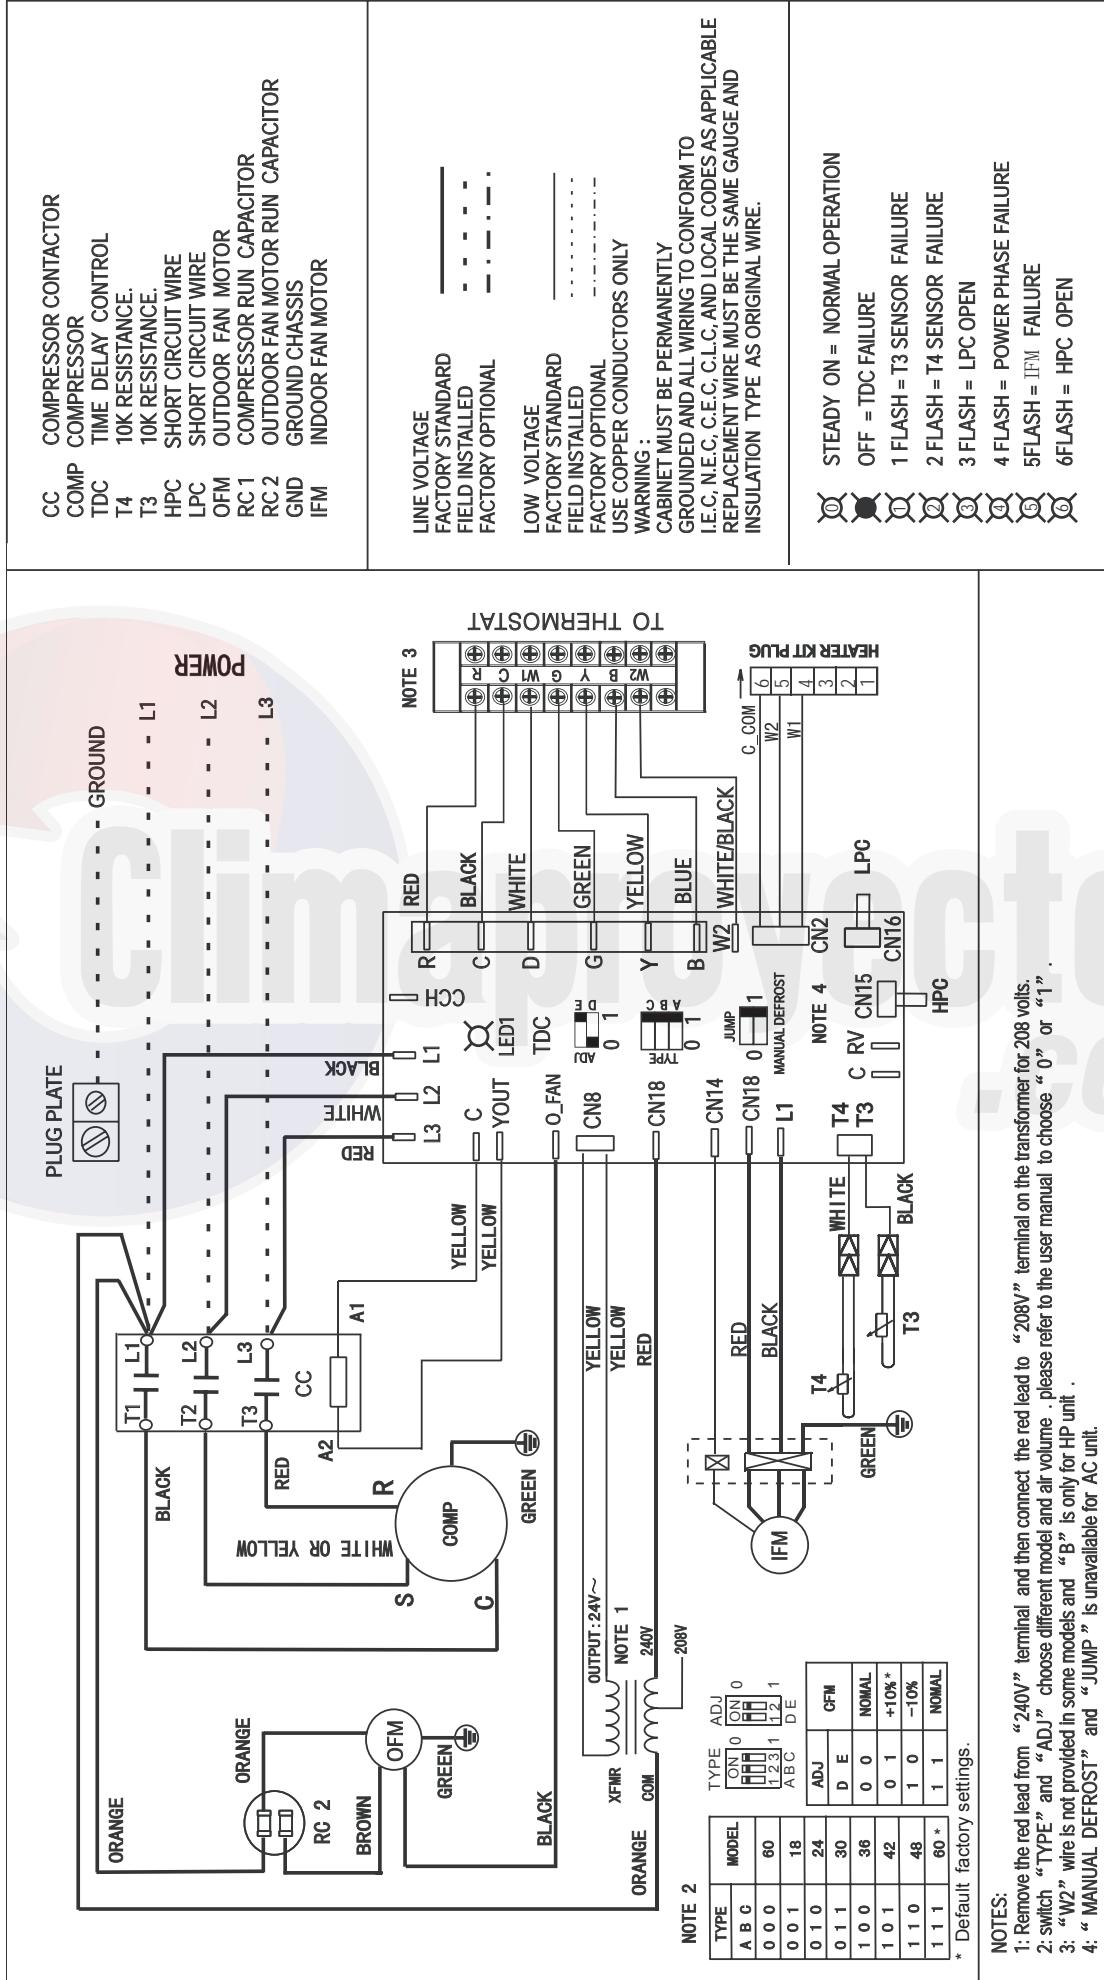

HP System Wiring Diagram (60K 1 phase)

* Default factory settings.

- notes:
 1: remove the red lead from “240v” terminal, and then connect the red lead to “208v” terminal on the transformer for 208 volts.
 2: switch “TYPE” and “ADJ” choose different model and air volume . please refer to the user manual to choose “0” or “1”
 3: “W2” wire is not provided in some models.
 4: “JUMP” and “MANUAL DEFROST” choose different defrost logic ,please refer to the user manual to choose “0” or “1”
